

NOTE: Data Center on-premises deployment requires special configuration of GUI and API servers. As part of the required support Viakoo will work with your IT team to ensure proper deployment.

Installation and Configuring of Viakoo Predictive OP

Viakoo Predictive OP is a version of Viakoo designed service to run within your own Data Center. It is installed within your corporate Data Center running VmWare virtualization VSphere Cluster. There are several Virtual Machines required for running different components of Viakoo.

Detailed guidelines are available to help your IT staff decide the specific configurations to optimize Viakoo Predictive OP within the corporate Data Center.

Viakoo Professional Services will provide remote support for the installation of Viakoo Predictive OP. Once installed, monthly reviews by Viakoo Support Engineering with remote client access are required in order to keep it running smoothly.

Details at Your Fingertips

Viakoo Predictive OP provides our flagship easy-to-navigate dashboard which allows you to see detailed information about the entire application, and information down to the device level. In addition, the Viakoo Phone App (iOS and Android) can be configured to work with OnPremises, providing the ability to receive alerts, manage tickets, generate compliance reports, and coordinate with your team
